

```

• import Vue from 'https://cdn.jsdelivr.net/npm/vue@2.6.12/dist/vue.esm.browser.js'
• </script>

```

You can check for the NPM package source at cdn.jsdelivr.net/npm/vue.

The framework Vue is made available for the developers at **cdnjs** and **UNPKG**. There is no latest release for **cdnjs**. So, it may not be fast to sync.

Look up and read about using the production version of Vue and its different builds. You can find it in the published site where `vue.min.js` is replaced with `vue.js`. Specifically, it is not built for development experience but to reduce latency during the development.

NPM

If you are developing a large scale application, it is advisable to use NPM installation method with Vue. That is because it provides optimal module bundlers such as Browserify and Webpack. Moreover, you also get to author Single File Components with the accompanying tools provided by Vue.

- # latest stable
- \$ npm install vue

CLI

Further, the leading framework helps in enabling official CLI for quicker complex development of Single Page Applications. It boosts setups built with
