

Runtime: Code that helps for building the instances for Vue. It also patches and renders virtual DOM. In a nutshell, it includes everything except the compiler.

UMD: With the help of a `<script>` tag, you can let the UMD builds to be deployed directly in the browser. The Runtime and `vue.js`, which is the UMD Compiler build is the standard jsDelivr CDN file that you can find at <https://cdn.jsdelivr.net/npm/vue@2.6.12>.

CommonJS: These are builds that are designed to compile with older bundlers like webpack 1 and browserify. `Vue.runtime.common.js`, that is CommonJS build, stands similar to the default file for `pkg.main` bundlers.

ES Module: ES Modules offer two builds right from 2.6 Vue.

- **ESM for browsers:** The one that can be used for 2.6+ only version, the ESM for browsers is designed to run in modern browsers for direct imports. It can be used with `<script type="module">`
- **ESM for bundlers:** ESM for bundlers are used for Rollup or webpack 2 modern bundlers. The format of the ESM is planned for statistical analysis. Thus, the bundlers can perform the “tree shaking” method and remove the redundant set of codes from the final release. The build for Runtime only ES Module is the default one to be taken advantage of here.
