

```
// mixins/formMixin.js

data () {
  return {
    formState: {
      activeField: 0,
      isNext: true,
      formLength: this.formFields.length,
      success: false,
      isValid: false
    }
  }
}
```

Declaring a data object

Add provide() from parent

```
// components/FormTemplate.vue

provide() {
  return {
    formState: this.formState
  }
}
```

Copyright Attribution: Medium

using provide()

Use inject in children

```
//components/formTemplates/formField/

inject: ["formState"]
```

Copyright Attribution: Medium

Using command inject

FormState can be accessed by any child of form-template>, no matter how deeply nested.

Through enabling visible data to move discreetly throughout the part hierarchy — without polluting the parent with a slew of props, v-ifs, and elses — provide & inject allows you to separate reasoning from presentation.
