

More information on form configuration

Different options required by different types of fields are often indicated by Form configuration. For example, text gap fillers and text-areas, checkbox and radio button collection choices, and so on.

```
// config/formConfig.json
// form configuration object with placeholder
{
  "type": "text",
  ...
  "options": {
    "attrs": {
      "placeholder": "Please enter your given name"
    }
  },
  ...
},
{
  "type": "radio",
  ...
  "options": {
    "choices": ["float", "dive", "dip"]
  },
}
```

Using checkbox

We need to conditionally bind related attributes to the input field since not all fields have the same attributes. The... spread operator can be used to extend the attributes ("attrs") object once more. Then, in the dynamic <component>, we v-bind it.

```
// form-template.vue

<component :is="InputBox"
            v-bind="{ ...field.options.attrs }"
/>
```

Using v-blind

Unlike placeholders, checkboxes and radio buttons provide users with a variety of options to choose from.
