

Since you can easily keep track of your data object and template portion, this increases speed. The v-model directive often eliminates uncertainty when it comes to ensuring the consistency of the data model.

We'll build a simple Vue visa app with a preview segment to show two-way data linking.

In the components folder of the Vue canvas project you downloaded from GitHub, you'll find the root Vue component, app.vue, and a test component file. In your construction world, open the project.

This is what your app.vue file may look like:

```
<template>
  <div id="app">
    
    <Test/>
  </div>
</template>
<script>
import Test from './components/Test.vue'
export default {
  name: 'app',
  components: {
    Test
  }
}
</script>
<style>
#app {
  font-family: 'Avenir', Helvetica, Arial, sans-serif;
  -webkit-font-smoothing: antialiased;
  -moz-osx-font-smoothing: grayscale;
  text-align: center;
  color: #2c3e50;
  margin-top: 60px;
}
</style>
```
