

Input Binding

You will see that there is a sample feature now that our visa application form is up and working. We want to show all the consumer types in the text boxes above in this segment. This eliminates the need for the consumer to run into each box one by one before hitting send. Instead, they will navigate down to the send button to see a short preview of the data they submitted.

The v-model directive may be used to connect the input in the prototype segment to the data item. This is how the input linking syntax can now look:

```
<h2>My first name is {{fName}}</h2>
<input v-model="fName"/>
```

The Property of Laziness

Since these bindings are made in real time, the software can change when you type. You may also use the lazy property of the v-model directive to allow it to show at the same time when you close a page. Add the lazy property to all the v-model definitions in the inputs in the component template.

Conclusion

This kind of highly interactive form can be applied to a variety of situations. It may be used as a communication form, a poll, a quiz, or a questionnaire, lead generation, or a survey, among other things. Since these modes enable our users to devote a considerable form of time to them, it's important that they remain both distraction-free and interactive. The usage of a clean form interface will aid consumers in completing our forms. Since all of the form questions are scattered over several slides, the progress bar allows people to be informed of their progress, giving them the impression that they're making progress and letting them see how much further they have to go.

We also introduced real-time authentication to ensure that correct replies are obtained while also allowing the consumer to go back and modify all of their previous responses. When users re-answer the query, validation remains the same.

Frameworks like Vue.js make it possible and interesting to gradually bring more functionality to a project like this over time, and the resultant immersive interface allows the tedious task of collecting user data more entertaining and enjoyable! **d**
