

Example of the global registration is as below:

```

• <div id = "Test _ Component">
•     <test1 _ c> </test1 _ c>
• </div>
• <div id = "Test _ Component1">
•     <test1 _ c> </test1 _ c>
• </div>

```

Below is the example code of template written in .js file:

```

• Vue.component('test1 _ c', {
•     template : '<div> <h1> Registering Global
Component </h1> </div>'
• });

```

Output:

Registering Global Component

Registering Global Component

Explanation of the code:

In the .js file, a template is created to which the above HTML code is assigned. We register the global component that can be used with any Vue instance. '<test1_c>' and '</test1_c>' are the custom tags assigned to the created components.

Similarly, the local registration can be performed in which the component is made the part of Vue instance directly. In local registration, the component will be part of the created Vue instance only. Consider the below example to understand the local registration:

```

• var vm = new Vue ({
•     el : '#Test _ Component',
•     Components:function's properties: {
•         'Test _ Component' : {
•             Template : '<div>
<h1> Local Registration of Component </h1> </div>
•         }
•     }
• });

```

Output:

Local Registration of Component
