

Data and Methods in Vue Component

As any other programming language has the feature of method or function, it is the case with Vue, too. Data and methods are two options in the Vue component. Let us check the below code snippet to understand the data and methods in Vue in more detail:

```

• <html>
•       <head>
•           <title> VueJs Example </title>
•           <script type = "text/javascript" src
= "js/vue.js"> </script>
•       </head>
•       <body>
•           <div id = "Test _ Component">
•               <test1 _ c> </test1 _
c>
•           </div>
•           <div id = "Test _ Component1">
•               <test1 _ c> </test1 _
c>
•           </div>
•           <script type = "text/javascript" src
= "js/vue.js"> </script>
•       </body>
• </html>

```

For the above html code, the js file contains the below code in template:

```

• Vue.component('test1 _ c', {
•     Template : '<div v-on : mouseover = "new-
name()" v-on : mouseout = "realname()"; "> <h1> Component
Created with <span id = "name"> {{ name }} </span> </h1> </
div>
•     data : function() {
•         return {
•             name : "John"
•         }
•     },
•     methods : {
•         newname : function() {
•             this.name = "Mary";
•         }
•     }
• }

```
