Parent Child Components

In such case, the following will be the component tree:

```
<BlogPostComponent>
  <AuthorName> </AuthorName>
  <PostInfo> </PostInfo>
  <Comments> </Comments>
</BlogPostComponent>
```

The division of components into 'child components' offers many benefits in terms of ease of code readability and manageability. When needed to be revisited in the future, the code can be easy to read so one can easily understand the structure of the page and where specific functionality is present. This structured code will be easy to understand for anyone who visits the code for the first time.

For the data passed from 'parent component' to 'child component', the code looks as below:

```
• new Vue ({
•   el : '#app',
•   data() {
•     return {
•       author : {
•         name : 'Mary
Dove',
•         email :
```
