

```

• <div id = "app">
•   <h3>
•     {{ count }}
•   </h3>
•   <counter : count = "count" />
• </div>

```

The code won't work in this way, as the value will not increment. To make the code work, we need to emit an event from the 'child component' and send the updated value of count to the 'parent component'. To do that, first of all, create the instance of Vue and then set that to 'eventBus' as:

```

• const eventBus = new Vue();

```

Below is the code for the child component:

```

• Vue.component('counter', {
•   props : {
•     count : {
•       type : Number,
•       required : true
•     }
•   },
•   methods : {
•     increment() {
•       this.count++
•       eventBus.$emit('count-
incremented', this.count)
•     }
•   },
•   template : `
•     <div>
•       <button @click = "increment"> + </
button>
•     </div>
•   `
• })

```

This event is emitted every time the increment method is called. The value of the count is set to the updated value after each increment when each event is emitted.

```

• new Vue ({

```
