

```

    el : '#app',
    data() {
      return {
        count : 0
      }
    },
    created() {
      EventBus.$on('count-increased',
(count) => {
        this.count = count
      })
    }
  })

```

**Output:** The value of the count will appear on the screen in the browser:  
1

## Nesting Components Using Slots

In the examples shared so far, each component has a self-closing element. But these components need to be nested within one another to take full advantage of Vue components and use them fully. Any code present within the opening and closing tags of the component gets replaced with the output of the component.

Nested Components

Copyright Attribution: Vuejs.org

Refer the below code snippet to understand the nesting of components:

```

<div id = "app">
  <AuthorName : owner = "author">
    <p> Code gets replaced </p>
  <AuthorName>
</div>

```

Code Snippet of components:

```

Vue.component('list', {
  template : '#list'

```
