

The fallback content is displayed when there is nothing to display from the parent component.

Output:

Slots

Child Component

First Slot

Child Component

Fallback Content

Conclusion

This is the high-level introduction to Vue components. Vue components have been small structures into which an application can be broken. These components can then be combined to form the full-fledged complex application. Components make the application modular and easy to manage. Also, it allows using the same component as many times as possible. Components also follow the nesting of components, where information can flow from 'parent component' to 'child component' and from 'child component' to 'parent component'. The communication between parent and child components occurs through 'props' and 'event bus'. Slots form another useful feature of components.

All these concepts have been explained in detail with examples in this article. We hope the article was helpful to you in understanding these concepts well. You can follow Digit to learn more about such concepts. Digit is a platform that enables learning and an easy grasp of technical concepts such as this.
