

4. Build or Create specific options for components by the global mixins such as Vue-router.
5. Build or create a library offering API using any of the above combinations, such as Vue-router.

A Plugin generally acts as a 3rd party tool or a set of code that solves the particular complexity and has standalone features to make the application smooth. This way, you can make the Vue components short, small, and precise for packaging and sharing.

Using a Plugin

Let's start with export for the plugin object. And then using the install method using the two main parameters of Vue Constructor and options object.

Writing a Plugin in Vue.js

Copyright Attribution:
Uploaded to <https://dev.to/>

```

• // plugin.js
•
• // For exporting the plugin object.
• export default {
•   // Here, install method is used with Vue constructor
and options
•   install (Vue, options) {
•     }
• }

```

Now as we move forward the plugin.js is imported into the main.js file.

```

• // main.js
•
• import Vue from 'vue'
• import MyPlugin from './plugin.js'
•
• // With options
• Vue.use(yourPlugin, {
•   someOption: true
• })

```
