- `// Without options`
- `Vue.use(yourPlugin)`
-
-
- `new Vue({`
- `el: '#app',`
- `render: h => h(App)`
- `})`

Here, you can choose to add any optional pass using the `someOption` method.

`Vue.use` plays a crucial role in preventing for installation of the same plugin repeatedly. So even if you can call the same plugin, again and again, it would be installed for once only.

As per the Vue.js documentation, official plugins for example, `vue-router` calls `Vue.use()` function if the `Vue` is a global variable in the code. Still, for a specific module environment for using `Vue.js` on CommonJS platforms, you have to call `Vue.use()` separately.

- `// For using Vue in CommonJS via Webpack or Browserify`
-
- `var Vue = require('vue')`
- `var VueRouter = require('vue-router')`
-
- `// And this keep you on the right path`
- `Vue.use(VueRouter)`

There are many free libraries and plugins collection available online that you can use to get specific features. (source)
