

Fast and the Feature Rich - Part 2

We hope that the May 2021 FastTrack would have piqued your interest and put you on the path to trying out one of the fastest and most feature-rich JavaScript frameworks out there. This month, we're focusing on some of the more critical features such as forms and components which are practically what user interfaces are made of. The key features as well as the unique aspects of Vue.js are largely brought to light via these two chapters.

We then look at scalability and extensibility. Scalability is a challenge that almost all developers hope to face one day because it implies that your software has been successful and has been adopted by many users. A lot of frameworks are feature-rich but they only work as expected as long as it gets plenty of resources. When a project scales, you can't afford to be as generous with resources because the costs add up and that scales much quicker than you'd like it to. Having a framework that is lean enough to not query the server for every little thing is a massive boon for folks working on large-scale public-facing projects. And Vue.js is a framework that's steadily growing in popularity in that domain.

Then comes the aspect of extensibility. A framework that can properly communicate with other languages and frameworks that would typically be deployed in a project is absolutely essential in building a service that works well. You don't want to manually code every single aspect, do you?
