

## Simple Routing From Scratch

If you just need basic routing and do not want to use a full-featured router library, you can do so by dynamically making a page-level component like this.

```
const NotFound = { template: '<p>Page not found</p>' }
const Home = { template: '<p>home page</p>' }
const About = { template: '<p>about page</p>' }

const routes = {
  '/': Home,
  '/about': About
}

new Vue({
  el: '#app',
  data: {
    currentRoute: window.location.pathname
  },
  computed: {
    ViewComponent () {
      return routes[this.currentRoute] || NotFound
    }
  },
  render (h) { return h(this.ViewComponent) }
})
```

Simple routing

When combined with the HTML5 History API, you can build a simple yet completely functioning client-side router.

Developing a Single-page Application with Vue + Vue Router seems natural: we're already writing our application with components in Vue.js. When we introduce Vue Router to the mix, we simply map our components to the routes and tell Vue Router where to make them. Here's a simple example:

## HTML

## JavaScript

By injecting the router, we receive entry to it as `this.$router` as well as the current route as `this.$route` within any component.
