

their views. This.\$root.\$data will also be accessible to subcomponents within any of these instances. Now that we have a single basis of reality, debugging will be a nightmare. Any piece of data may be updated at any moment by any member of the app, without leaving a trail.

```
var store = {
  debug: true,
  state: {
    message: 'Hello!'
  },
  setMessageAction (newValue) {
    if (this.debug) console.log('setMessageAction triggered with', newValue)
    this.state.message = newValue
  },
  clearMessageAction () {
    if (this.debug) console.log('clearMessageAction triggered')
    this.state.message = ''
  }
}
```

Store Pattern

All actions that change the status of the shop are performed inside the store itself. This type of centralized state control makes it simpler to understand what mutations might occur and how they are caused. When anything goes wrong, we'll now have a log of what happens before the bug.

Server-Side Rendering and Security

Vue.js is a client-side web development platform. Vue

```
var vmA = new Vue({
  data: {
    privateState: {},
    sharedState: store.state
  }
})

var vmB = new Vue({
  data: {
    privateState: {},
    sharedState: store.state
  }
})
```
