

Using a template:

```
<div v-html="userProvidedHtml"></div>
```

Using a render function:

```
h('div', {
  domProps: {
    innerHTML: this.userProvidedHtml
  }
})
```

Using a render function with JSX:

```
<div domPropsInnerHTML={this.userProvidedHtml}></div>
```

HTML template

via javascript, there is a possible security problem. There are repositories that can assist with this, such as [sanitize-URL](#), but keep in mind:

If you use URL sanitization on the front end, you still have a security issue. Before being saved to a folder, user-supplied URLs can first be sanitized by the backend. The issue is therefore prevented with all clients connecting to your API, including native smartphone applications. It's also worth noting that, even with sanitized URLs, Vue can't promise that they'll take you to secure places.

Injecting Styles

If <a

```
v-bind:href="sanitizedUrl"
```

```
v-bind:style="userProvidedStyles"
```

```
>
```

```
click me
```

```
</a>
```
