

And for folks who'd like to get a headstart, there's a codepen with all the dependencies already linked here - <https://codepen.io/itslit/pen/QMzRev>

Project outline

We've already established that our project will be a movie app interface similar to what Netflix looks like. With that in mind, let's break down all the functional modules and pages that we'll have to code.

Once the app is fired up:

- We'll be met with an introduction or landing screen
- A menu of some sort that will list a set of movies that the user can browse
- A movie detail screen that displays the movie's title and description along with a button to play
- A trailer page for the movie that users can explore to decide whether to watch the movie or not
- A feature to mark movies to be watched later or a favourite button

Certain elements of the user interface will be shared across multiple views and we'll be using the same work area for switching between different views.

Movie Data

We'll need several pieces of information regarding the movie such as the title, description, image, trailer link, release date, duration, etc. and other metadata that would usually be sought after by the user. In this project, we're focused on movies directed by Christopher Nolan. This is our global movies store and we'll be using this to build the UI. Here's what our movie data would look like:

```
• const movies = {
  • "dunkirk": {
    • "id": 'dunkirk'
    • "title": 'Dunkirk',
    • "subtitle": 'Dunkirk',
    • "description": 'Miraculous evacuation of Allied sol-
      diers from Belgium, Britain, Canada, and France, who
      were cut off and surrounded by the German army from the
      beaches and harbor of Dunkirk, France, during the Battle of
      France in World War II.',
    • "largeImgSrc": `url('https://image.tmdb.org/t/p/w780/fudE-
      G1VUWuOqleXv6NwCEXK0VLY.jpg')`,
    • "smallImgSrc": 'https://image.tmdb.org/t/p/w185/fudEG1VU-
      WuOqleXv6NwCEXK0VLY.jpg',
```
