Creating the instance

We've outlined all the information that we want to display in our UI. Next we need to decide how to showcase it. Thankfully, we've got several popular streaming services to seek inspiration from. Let's commence building the interface.

We'll start with creating the Vue instance. We also need to attach this new Vue instance to the DOM element `app` and return the global store `movies` as part of the instance's data object which will be used by us to build the remaining part of the UI.

```

• const rootApp = new Vue({
•   el: '#app',
•   data() {
•     return {
•       movieChoices: movies
•     }
•   }
• })

```

That was quite simple, wasn't it? Let's move onto the rest of the elements now.
