

Fixed Footer

We'll use a fixed footer as the share element which will be present in multiple views. In this fixed footer, we'll host the list of movies present in our data store at all times.

```

• <div id="app">
• <section class="hero is-primary is-medium">
•   <div class="hero-foot">
•     <div class="columns is-mobile">
•       <div v-for="movieChoice in movieChoices"
class="column">
•         <li class="movie-choice">
•           
•           <p class="mobile">{{ movieChoice.subtitle }}</p>
•         </li>
•       </div>
•     </div>
•   </div>
• </section>
• </div>

```

In the above code, we've created a new DOM element which has the `id="app"` and our Vue instance will be attached to the same. We then use the CSS framework to create a basic footer and within that we use the `v-for` directive that we saw in the previous FastTrack to render a list from our global movies data source called `movieChoices`. For each movie that's listed in `movieChoice`, we then attach an image to the `smallImgSrc` url to be displayed for desktop browsers. When viewed on a mobile screen, we use a Mustache syntax for data binding to show the `movieChoice.subtitle` on mobile screens.

Once the CSS styling is done, the app should look like this when viewed on Desktop screens.
