

And like this on mobile screens.

Intro Component and Vue-Router

The next set of components will be sharing the same workspace. We'll be building the Intro, Movie and MovieTrailer components. This is where we'll be using the vue-router library to allow for component-based router configuration and nested views mapping. Let's build the template first.

```

• const Intro = {
•   template:
•     `<div class="hero-body" style="background: #1e1d1d">
•       <div class="container has-text-centered">
•         <div class="columns">
•           <div class="column is-half is-offset-one-quarter
vertical-align">
•             <h1 class="home-intro">
•               VueFlix
•             </h1>
•             <p class="home-subintro">Select a movie below
from the list of critically acclaimed Christopher Nolan
films.</p>
•           </div>
•         </div>
•       </div>
•     `
• }

```

Then we'll define our first route component called Intro.

```

• const routes = [
•   { path: '/', component: Intro },
• ]

```
