

We'll follow this up by instantiating our router new `VueRouter`.

```
• const router = new VueRouter({
•   routes
• })
```

Now that we have created our view router, we need to inject the same into our Vue instance to ensure that our app can use the router and render whichever DOM elements are called up.

```
• const rootApp = new Vue({
•   el: '#app',
•   router: router,
•   data() {
•     return {
•       movieChoices: movies
•     }
•   }
• })
```

We then need to render our route component in the DOM using the tags `<router-view></router-view>`.

```
• <div id="app">
•   <section class="hero is-primary is-medium">
•     <router-view></router-view>
•     <div class="hero-foot">
•       <div class="columns">
•         <div v-for="movieChoice in movieChoices"
class="column">
•           <li class="movie-choice">
•             
•             <p class="mobile">{{ movieChoice.subtitle }}</p>
•           </li>
•         </div>
•       </div>
•     </div>
•   </section>
• </div>
```

We've created our router and instantiated our router and then rendered it in the DOM. Our project should now look like this.
