

Movie Component

Once we have the basic app UI functional, we need to look at the different paths that the user might take. Let's build our Movie component next. This will display all the information pertaining to the movie that we had initially created and stored in our global movie store.

We'll start off with setting up the navigation which is via the footer. To do this we'll be using the router-link component within vue-router to provide the target location for the next component. Let's edit the footer section to incorporate this change.

```

• <div id="app">
• <section class="hero is-primary is-medium">
•   <router-view></router-view>
•   <div class="hero-foot">
•     <div class="columns">
•       <div v-for="movieChoice in movieChoices"
class="column">
•         <router-link :to="/${movieChoice.id}"
•           tag="li"
•           class="movie-choice">
•           
•           <p class="mobile">{{ movieChoice.subtitle }}</p>
•         </router-link>
•       </div>
•     </div>

```
