

Movie Trailer Component

This component is going to be relatively simple. We'll be using an iFrame to display the movie's trailer from YouTube. We have stored the YouTube URL for the movie trailer in the Global Movies data Store. We can use the `$route.params.id` to pull the YouTube link and then render that within the iFrame. Here's how we'll be doing that.

```

• const MovieTrailer = {
•   template: `
•     <div class="trailer-body" style="background: #1e1d1d">
•       <div class="has-text-centered">
•         <div class="columns">
•           <div class="column vertical-align">
•             <iframe
•               allowFullScreen
•               frameborder="0"
•               height="376"
•               :src="trailerUrlPath"
•               style="width: 100%; min-width: 536px"
•             />
•           </div>
•         </div>
•       </div>
•     </div>`,
•   data () {
•     return {
•       trailerUrlPath: movies[this.$route.params.id].trailer-
Path
•     }
•   }
• }

```

We've used the property `trailerUrlPath` to bind the YouTube URL for the trailer.

The accompanying dynamic route:

```

• const routes = [
•   { path: '/', component: Intro },
•   { path: '/:id', component: Movie },
•   { path: '/:id/trailer', component: MovieTrailer }
• ]

```
