

With that done, our project UI will now show the YouTube trailer when we click on the play button.

Favourites List

A common feature in many streaming apps or multimedia consumption apps is the ability to make playlists. You can give a like or mark the movie for a later watch. In our project, we'll be marking movies that we like as our "Favourite". To do this, we'll use a simple boolean attribute to let the UI know if the movie has been marked as favourite or not. To distinguish a movie that has been marked as favourite, we'll be adding two visual cues. The first being a very noticeable yellow-coloured shadow around the entire Movie component. The other will be a little checkbox in the footer.

To do this we have a few CSS elements that will be toggled. We will use the class `.favourite-shadow` which will put a yellow `rgba(251, 255, 15, 0.25)` box-shadow around the movie element. And then we'll use the `.favourite-check` class to place the check mark.

- `.favorite-shadow {`
- `box-shadow: 0 0 50px 15px rgba(251, 255, 15, 0.25);`
- `}`
- `.favorite-check {`
- `position: absolute;`
- `right: 5px;`
- `top: 5px;`
- `z-index: 1;`
