

- vi. Now refine and finish the animation of the character.
- vii. Now integrate and retarget the animation for your character models.
- viii. Finally, check the animation in the 3ds Max character and send the animation character to the 3ds Max.

2. Generic Workflow

For those using any other 3D software package, there are converters available to change them into FBX. You can also download them via the Autodesk FBX site.

These FBX plugins allow you to export and save the file in respective .fbx file formats. Once exported into the modeling software, the .fbx format can be easily loaded in MotionBuilder, then one can animate and export specific character models by using preferred FBX plugins.

To understand more read the MotionBuilder documentation for legacy Workflow.

Introduction to MotionBuilder Interface

MotionBuilder Interface allows users to operate with 3D objects and build seamless animation for their multimedia projects. Several elements are provided to give the user more control in MotionBuilder-

1. Main Menu
2. Views and Displays in the second row
3. Viewer
4. Camera Navigation Control
5. Camera View Toolbar
6. Viewer Toolbar
7. Character Controls
8. Transport Controls
9. Navigator
10. Key Controls
11. Animation Layers Editor
12. Resources Window

You can view the different 12 controls in the image on the next page.

Let us now study each of them to understand more about the MotionBuilder Interface.

1. Main Menu

MotionBuilder Interface's main menu covers all actions, tools, and settings
