Modern view of the AutoDesk MotionBuilder Interface

for your activities. Main topics in this include File, Edit, Animation, Settings, Layout, Python tools, Window Menu, and Help, to get started.

2. Views and Displays in the second row

Right below the main menu is the Views and Displays menu to enhance user views. View menu adds the options to view your current scene with options for choosing between single panes, two panes, three or four panes, depending on your requirements. Each pane offers a unique perspective for your 3D character from a different direction. Display Menu provides multiple ways to further display the assets in the viewer. User options include Normal, X-Ray, Models only, Hide selected, Show selected Models display, visibility, Stereo display, Heads-up Display, and Invert Normals.

3. Viewer

The Viewer is the main section or workspace of the MotionBuilder interface that allows users to check and view the current selection and animation of a character. You can work with one or multiple viewer windows with a number of views. You can view the animation and transform the objects as you go build them for a smooth 3D transition. All the objects, animation, and scenes are rendered in the Viewer window only.
