

4. Camera Navigation Control

This adds the capability to move the camera at a desired point on the 3D character with either a left or right drag from a mouse. There are five main sections including orbit for revolving the current view, travelling for sliding the camera over the area of interest, dolly that allows you to set up and control complex rails for moving the camera around the object, zoom to enhance the object, and roll to change the view from the side to side.

5. Camera View Toolbar

View toolbar allows you to customise the window display with multiple options. There are four main values here:

- Ruler – To evaluate the distance on the viewer window.
- Trajectories – On using and clicking the Trajectories option, the user will be able to check the trajectory of an object in the current window.
- 2D Magnifier – Allows to first lock and enhance the current camera view.
- Selective Redraw – Allows refreshing the current scene without affecting any other operation.

6. Viewer Toolbar

This section represents the toolbar along the right side of the viewer window. There are multiple options to select, customise, and transform objects that are present in your Viewer window. Selection, Drag, Rotate, Local/Global, Scale, snap rotation, pivot shift, Z-depth selection, and Object mode tools are the essential functions of the Viewer toolbar.

7. Character Controls

These options allow users to create and build characters using multiple options. There are four main sections.

- A – Character Controls menu button
- B – Start Pane
- C – Character Menu
- D – Source menu

With Start Pane, you can begin the character setup process using a skeleton or any motion capture in the animation. And with these unified character control windows you can almost set all character tasks efficiently using hundreds of options.
