

8. Transport Controls

This allows for the users to maintain the time progression of the whole animation. Several key parameters in the Transport Controls include build and select frames, set time, create a new start and then end the take, whole action timeline, and manipulation settings for the keyframes in the animation.

9. Navigator

The navigator window is the main bottom part of the MotionBuilder interface that allows managing assets, scenes, controls, and multiple animation controls in your current window. The Navigator provides four sections to ease your animation operation,

- Navigator Window: This is the main default section in the bottom section with view and scene elements.
- Dopesheet: Allows users to check and view the keyframes for the animation.
- FCurves window: Allows users to operate with animations via the function curves.
- Story window: For building an animation in the form of a series of clips, similar to a video editing software.
- Animation Trigger window: Check and test the animations or motionclips triggers

10. Key Controls

This allows the user to work in building and customising keyframes in the animation process. There are multiple options and menus for editing keyframes with the Animation menu, Layer menu, Keyframe buttons, Keying mode menu, and Key Interpolation Type menu. The main functions that you can function from the Key controls are setting keyframes, work with animation layers, interpolation mode, keying groups, set-
