Key Controls in MotionBuilder Interface

11. Animation Layers Editor

This gives you access to all the animation layers for getting desired results from the animation. You can create new layers and mix any number of animation layers in the current window scene. It has four main sections with – Animation Layer toolbar, Pane, context menu, and respective properties for layer.

12. Resources Window

This provides comprehensive access to all the channels and properties for the elements in your current window scene. You can customise or set for a particular window by selecting the specific properties. Here in the Resources Window, users get access to all the Properties, Filters, Sets, Groups, Asset browsers, and the Pose Controls.

Conclusion

In this chapter, we learned all about the MotionBuilder workflows to work with Autodesk files and from any other 3D software packages. The interface is the first impression of the MotionBuilder Autodesk to kick start your learning curve. Users must practice regularly to get more accustomed to the varying effects to include in 3D animations. In the next chapter, we will study more about Character Models. **d**
