

such as file processing and rendering via the Command Line. It supports Safari, Google Chrome, Internet Explorer and Mozilla Firefox as browsers.

Here we have a detailed walkthrough of how to use Autodesk MotionBuilder as an effective animation software.

Interface

MotionBuilder, like other applications, provides basic interface elements that allow you to execute general activities.

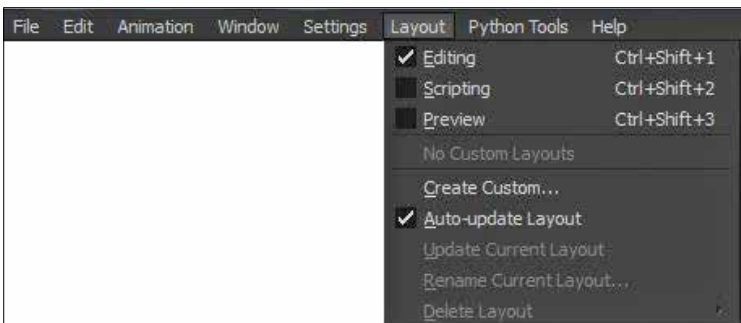

It enables you to use the menu bar to perform actions such as constructing and saving a scene, launching, amalgamating, and storing information and selections, transferring scenes to 3ds Max and Maya, transporting audio, video, and point cache files, exporting and importing motion files, batch processing and rendering files, adding and saving file properties, and exiting the application. You may also use the menu bar to modify and animate components in your scene, show and hide windows, change preferences and interaction mode, choose a layout or build a custom layout, access Python Tools, and access different help menu choices.

Layout Menu

The Layout option lets you select between preset editing, scripting, or preview layouts and custom layouts for specific tasks. The layout is set to editing by default. The Layout menu may also be used to create, rename, edit, and remove layouts.

Help Menu

The Help menu includes resources for learning, support, and development.
