

keyframes through the Transport Controls window. In every preset layout, the Transport Controls panel is shown by default.

Navigator Window

The Navigator Window allows you to see the structure of your scene, view asset relationships, and change an asset's parameters.

Navigator Window

Python Editor

The Python Editor offers a stable environment for end-users to develop scripts and tools, as well as interact with MotionBuilder. You may use the Python Editor to run single-line scripts, multi-line scripts, and global scripts. It also allows you to set up MotionBuilder to collect scripts remotely, build automation scripts, load and store script data, and construct custom MotionBuilder tools.

Scenes

Make sure you have set your Maya project and stored the scene you want to use in MotionBuilder to the currently set project before sending your Control rig to MotionBuilder.

Sending a New Scene to MotionBuilder

Select at least one character element and the Maya objects you wish to send to MotionBuilder in the Outliner, viewport, or HumanIK window.

Select **File > Send to MotionBuilder > Send as New Scene**

Animate or apply motion capture data to your Control rig using MotionBuilder. To send the rig to Maya, go to:
