### 12. Active source baking onto the current character

Select [Character Controls menu button](#) > [Bake](#) > [Bake To Skeleton](#) or [Select Character Controls menu button](#) > [Bake](#) > [Bake To Control Rig](#).

### 13. Retargeting parameters in the Attribute Editor

Select [Character Controls menu button](#) > [Edit](#) > [Definition](#) > [Edit Properties](#).

## Cameras

A camera view is used while observing your 3D scene via the MotionBuilder Viewer window. The camera reflects your point of view, framing your perspective of the items inside the MotionBuilder 3D environment.

MotionBuilder supports a variety of camera perspectives, some of which may be customised and others that have predefined angles.

### Producer Cameras

The first seven cameras in the Scene browser's Cameras folder are the Producer cameras. Producer cameras are supplied as default cameras with predefined perspectives for placing models and components in a scene.

A Producer camera cannot be seen in a scene, nor can it be selected as a camera interest or renamed. Furthermore, some camera settings, such as displaying the near and far clipping planes and changing the horizontal and vertical aperture, do not apply. Each Producer camera offers a unique perspective on the scene.

### Customising the Camera's View

Using the Camera settings View options in the Properties and Navigator windows, you may reveal and conceal items shown in a camera's view, such as the camera interest, viewer window grid, time codes, and so on.
