

Objects

By choosing and clicking the Update button or selecting Update Current Scene, you may update and/or add new objects to the other application. Note that using the Update feature, objects are not removed. You must remove an object in the scene if you no longer wish to utilise it.

Choosing Update Current Scene adds new scene objects, while Add to Current Scene copies existing objects rather than updating them.

For update operations, the control rig, skeleton, and bound geometry are treated as distinct character components that must be handled separately.

Object Manipulation

You may modify an item manually using the basic Transformation modes, or you can associate it with a device that controls its movement. You may change the pivot points from which the object is controlled, or you can control it with a Handle. Degrees of Freedom may also be defined to restrict an object's mobility.

Transform Objects

All 3D objects contain groupings of values (X, Y, and Z values) that define the size, orientation, and position of the item in 3D space. All three values are 0 at the genesis of an object. This implies that $X=0$, $Y=0$, and $Z=0$, as defined as (0,0,0).

You may relocate, resize, or re-orient an object in 3D space by altering its X, Y, or Z coordinate values. When this is done on a 3D object, it is referred to as transformation.

When you alter an object, the transformation is performed by default from a starting point or 'pivot' in the object's centre. You may change the Transformation pivots to transform an object from a place other than its own origin.
