Transforming objects

Adding Objects to the Scene Using the Asset Browser

You may drag FBX-based files, objects, and components from the Asset Browser to the Viewer window. MotionBuilder comes with different objects and components by default.

Click the Asset Browser tab in the Resources window. To see the available assets in the Asset Browser, choose an asset type. When you choose Character, for example, character assets appear as icons in the space alongside the asset list.

Drag an asset's icon onto the Viewer window to add it to the scene. When an FBX file is added to the scene, you can open it as a new scene or merge it with the existing one.

Take 001

This section of the context menu displays a list of the takes in the .fbx file. When you choose the take name, the current scene is reinstated with the keyframe animation on the assets and models associated with the chosen take.
