

Nodes are always placed in a hierarchical order that reflects how they are built. Each node has a label that specifies what it symbolises, and if you zoom out far enough, only the root nodes' labels appear. Because nodes visually depict every item in your environment as a single rectangle, they make it straightforward to concentrate on object connections.

Nodes

Model nodes are light grey by nature or the colour of their element. By default, nodes representing markers, nulls, camera interests, and skeleton roots are red.

In the Schematic view, three models are represented by nodes. Nodes representing hidden assets are shown in dark grey. Select the hidden assets and press Shift-S to make them visible. Nodes representing visible assets are light grey or the colour of the substance they represent.

The Schematic view allows you to group nodes into parent-child relations and build hierarchies to describe more complicated objects. **d**
