

Introduction:

Anime and other cartoons are becoming so engaging with passing time. It feels more sharp, realistic, and engaging than ever before. Have you ever thought about how it is becoming easier and better to create such amazing cartoons and anime characters? There is a lot of effort, creative minds, and software behind the rigging of these characters. Rigging is an important part of character creation as it is the time when the character skeleton is developed. There are so many softwares that are available in the market that can do the same thing; rigging a character and providing its desired motions.

One of the best products/ software in the market is MotionBuilder which is now being extensively used by many programmers and designers. With an array of tools and shortcuts; there is no denying that MotionBuilder gives a better chance to the designer to bring out the best in the character. This was just an overview to give you an idea of how things work and what they are. Let's take a deeper look at the entire process and how it happens to be a critical part of any character-building process.

What are the steps you need to follow to characterise your character?

We have already discussed the rigging process's importance in the MotionBuilder software. But now let's take it a few steps ahead. In this section, you are going to learn various processes that are included in the rigging. This section will also educate you on how to characterise your character in depth.

Adjust the limbs in the right position (accurately)
