

But before that, you need to know that there are three important steps that should be understood. First is T-posing, the second is character mapping, and the third one is characterising the character. In T-posing you have to accurately align the limbs of the character whereas in character mapping, the mapping list will define the hierarchy of the character so that the MotionBuilder software can understand it better.

In the third and last step, the control rig is used to animate the character properly with all the movements. These are three important steps inside which you get a lot of other steps making it a complete-character building process.

What are the things required to get the T-pose step accurately done?

One of the most important and initial steps of character setup is T-posing. One of the critical steps in this is to perfectly align the stance or pose of your character. The entire characterisation process is based on this process. During the T-pose setup of the character, all the IK and re-targeting calculations are based on the way you adjust the limbs of the character. As

The T-pose is an important step of the character setup because this is where rigging starts.

we have already discussed that your other two character setup steps depend on this one; so do it as accurately as possible. So, follow the steps in the right manner to get a desirable output in the end. The first thing that the designer has to keep in mind is to keep the character standing upright. Then keep its face upright looking ahead and the arms in the T-shaped posture towards the sides. In this step, you will have to keep all the limbs of the characters visible and straight.

All the limbs should be in such a way that you are able to see them all. You might have seen a lot of places where the knees and elbows are a bit bent and the spine slightly curved. These postures help in IK better because the slight bend in the limbs can save popping or overextension of the limbs. But even in this, you will have to keep in mind that bending
