During the arm rotation, it is important to align the shoulder, hands, and fingers one by one so that you don't mismatch anything.

Character mapping has to be completed

The next important step is to map the complete character after doing everything needful. Also, an important thing that the developers have to keep in mind is the mapping process. Even before you characterise your character, you will have to execute a step in which you will be describing the structure of the character in such a way that your software- MotionBuilder can understand every point. To fulfil the process you will have to add the joints into the right slots in the character definition. This is also called the mapping list window and the entire process on which this is done is called, “Character Mapping.”
