

point on frame 13, which is when one step is finished. The procedure now takes a bit longer, but it will ensure that you have a perfect cycle. Now you have to copy the locations and rotations parameters for the posture on frame number 13 onto the planted foot planting on the initial contact position. As a result, you're essentially duplicating the contact locations. The

Copy pose

backward-extended arm on frame one will become the forward-extended arm on frame number 13, and so on.

- Take the Pose on frame 1.
- Go to Pose>Copy Pose>move to frame 25 on the timeline.
- Select Pose>Paste Pose>
- This step should yield you three contact positions and three complete step positions.

Creating the Walk Cycle's Down Positions

The down posture is the next important pose to create a perfect walk cycle; this happens at the lowest point of your body, and the bodyweight has started to move over the alternate leg which is supporting. The rear foot is beginning to lift and pull away from the ground. You don't need the rear foot upwards from the ground, in the down position; instead, maintain the toes grounded and the foot's heel elevated up. This posture should be done on frame four and frame 16.
