

Frames 10 and 22 should be used to produce the Up position. Now that you've created all of the key postures, you should have a walk cycle that moves realistically! Simply by establishing these four primary essential postures, you have laid the groundwork for a strong walk. All that's left now is to fine-tune the walk motion and begin applying the finishing touches. The Walk Cycle is being polished.

The next stage is to add the remaining 10% of the animation, such as lead and follow on the head, and drag on the wrist and arms. Also, make any last tweaks to the overall walk animation. Don't run over the hips and feet again during this pass to attempt to remove some of the popping in the

A complete walk cycle

knees that happens during walks. You may also add some movement to the fingers to ensure that they move appropriately along with the walk and do not remain in the same position throughout the animation.

A walk cycle may appear to be a difficult animation to master, but if you prepare ahead of time, study the four primary positions required, and pace it right, it's actually one of the easier animations to master. Now, because this was a simple “vanilla walk,” you may play about with the timing and postures to give the walk more individuality.

Tips for creating a good animation

1. **Reference and Study-** Animation is the art of making the characters alive; without animation, the characters will not tell the story they were
