

should be leaning forward, and the rear foot's heel should be raised off the ground. After you've blocked in this position for your character, go over the four major positions again for the other leg. After you've blocked both sides, you can cycle the animation before refining it.

7. **Weight of Up-and-Down should be fine-tuned-** You'll want to pay attention to the weight of the character. Adjust the up and down weight parameters usually Translate Y for the control to get the right weight. Consider your character's hips to be a bouncing ball. To produce something that looks like a bouncing ball, use this particular visualisation to help modify the curves. You might notice a difference in your legs, but don't worry about it just yet. You should improve the shoot from root control down in most animations. This happens because any changes that you make to the root will impact the legs, so make sure everything else in the hierarchy is in order before tackling the legs.
8. **Side-to-Side Weight should be fine-tuned** - It's time to fine-tune the side-to-side movement after you've perfected the up-and-down movement that is usually called the TranslateX. Adjust the curves in the graph editor to ensure that the spacing is proper. In most situations, do not add more keys during this stage because adjusting tangent handles is typically enough to appear genuine. The hips should be precisely over the planted foot, according to a reasonable rule of thumb. When your character's weight is moved from side to side, they will seem balanced.
9. **Fine-tune your chest movement-** It's crucial to perfect chest movement, as the upper body of your character may bring so much vitality and charm to your stroll. It might give your character a touch of an attitude if they have huge, broad chest rotations. Use this to your advantage if that's what you're after. If that's not what you're after, keep the chest rotations basic to make it more credible. Keep in mind that if the arms move, so does the chest. Nobody goes around with a completely motionless chest.
10. **Modifying the arms by using Drag, Lead, Follow-** It's time to modify the arms after the chest has been polished and looks wonderful. At this stage, you may begin to add drag, lead, follow in the arm joints. Consider the arms as a sequence of movements that resembles the chest movements. The shoulders are the first to move, then the upper arm, elbow, and wrist. Enjoy and have a good time with it and play with the number of times of overlap and drag you use in your animation.
11. **Knee Popping Can Be Fixed-** After you've finished working on your upper body, it's time to concentrate on your legs. This usually entails
