

# Animation

This is where all the magic happens,  
this is how to use MotionBuilder to  
bring out motion and emotion.

## Introduction

Animation is the method using which one can manipulate the characters in the images to create an illusion of movement. In traditional animation, images are drawn on the celluloid sheets manually and then photographed to exhibit as film. Today, most of the animations get generated using computer animation. The person involved in creating animations is called an animator. Animators use different computer technologies to create animations by capturing the images and arranging them in the required sequence. Keyframing is one of the basic concepts of animation that is used to add motion to the objects in images. In this chapter, you will learn about keyframing and its related concepts.
