

FCurve

FCurve, also called the Function Curve, is the graph of a function. In terms of animation, FCurve is the animation curve comprising many keyframes. Simply put, FCurve is the graphic representation of animated parameters concerning time. The keyframes can get represented as curve segments, points, and tangents. The keyframes, when plotted on the graph, display the position as regards zero. The FCurves help in editing the animated parameters with defined keyframes. It can have different shapes, and different shapes demonstrate the different motion types. The following are the basic FCurves motion types:

- **Constant Motion:** It means the object is moving with constant speed.
- **No Motion:** It means that the object is static and not moving.
- **Acceleration:** It means that an object is moving while constantly gaining speed.
- **Deceleration:** It means that the object is moving while the object's speed is constantly decreasing.

Creating FCurves

Follow the below steps to create the FCurve:

- Open the Layer Properties Editor and click on the layer to open the Layer Properties.
- Under the Transformation tab, click on the Function Arrow button or the Function button to open the drop-down. Create Bezier, 3D Path,
