

Velobased, or Ease curve using the options in the drop-down and click on OK.

Editing FCurves

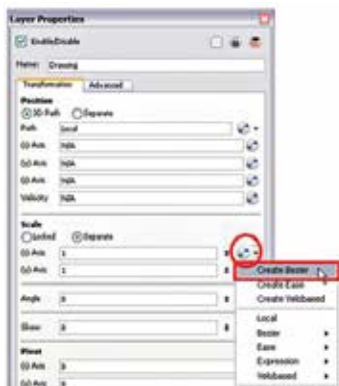

- To edit the FCurve of a specific object, select its animated property in the FCurve Property Pane. Keyframes will appear as the small dots along the FCurves. Click on any dot to select that keyframe or Control+Click the keyframe to select the keyframe region.
- Enter the frame number or drag it to change its time, which signifies that it will occur sooner or later than the original time value.

Layer Properties Window

Layers

The layers in animation is the concept used to stack the animations one over the other that helps in adding or changing any element in the animation sequence without destructing the overall continuous sequence. Experienced artists use the layers concept to edit image applications. They used multiple layers of the images, which are the layers of animation in this case.

FCurve Selection Dialog

Types of Animation Layers

There are two types of layers in animation layers:

1. Additive Layers
2. Override Layers

1. Additive Layer

The additive layer adds the animations on the existing layers getting used for animation. For example, consider that a character is getting animated,
