

found MotionBuilder to be good enough, it's sufficient to say that we can all jump on board.

In this FastTrack, we'll be covering the basics of Autodesk MotionBuilder to get you up to speed with the interface followed by the process of setting up a character which will be animated down the line. After making the character move and walk, we'll delve into the concept of looping animation clips. This will be followed by a few chapters dedicated to lighting and shading before finally rendering the animation and bringing it to life.

We hope this FastTrack gives you a good idea about MotionBuilder and sets you up to start on your animation journey. You might also want to check out one of our previous FastTracks in which we covered Adobe Animate just to get a better idea of similar but not exactly competing tools.

As always, we're open to suggestions on improving the FastTrack and covering new topics. Please reach out to us on editor@digit.in
