Triggers in Animation

We all have played computer games and know that the characters in the computer games can walk, run, climb, jump, and perform several other actions to reach the goal and complete the game. All these actions can be created by the user with the help of motion capture data or using a motion clip with a keyframe. The created characters can then be plotted to the skeleton of the character and saved as files with .fbx as an extension.

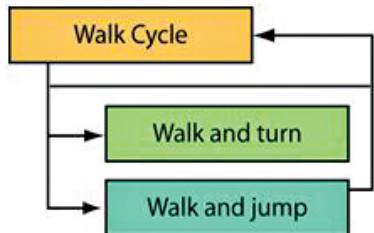

Control Rig Plugins

Animation Trigger Window provides support to both character animation and shapes animation. Therefore, the created file can get tested on the Animation Trigger window, which helps perform the testing of both continuous actions, such as walk, run and non-continuous actions, such as jump. Make sure that the flow of motion clips is seamless so that they stimulate realistic action.

Creating Motion Clips

It is advisable to plan the motion clips beforehand so that smooth transitions can get created. Correct clips should be blended with each other so that the motion clip should trigger from beginning to end with the next clips in between. As an example, to create the motion
