

3. There can be many motion sources or input types that can be selected from the source menu for animating characters.
4. Select either actor or character or control rig or current skeleton.

Thus, the character or animation can be imported easily, depending on your preferences.

Loading Animation

When you save the character animation by pressing the Windows control key, followed by the file, and then the save option, you can load the character animation. For this, follow the below process to load the character that was designed previously.

To create the character, you should have the 3D package and FBX plugin installed in your system. You can then load the character model in the application and perform character mapping and characterisation.

You can select the character from the drop-down list and choose the load option. From here, you can select the *.fbx file to load the animation. However, if you upload more than one animation file, then they will appear in alphabetical order. You can create the character model and choose from the motion source that can be either a control rig or motion data and another character.

The selected animations can then be edited by creating the control rig. These plotted animations can then be controlled through a control rig. These control rigs can again be used to create poses and animated keyframes. The created animations can then be plotted from the control rig to the models' skeleton that can be saved and exported after that.

When the character is uploaded into the application and set up for animation, three types of motion sources will be displayed as listed earlier. These motion sources can be either a control rig or actor connected to the motion data or another character.

Refining Animation

The animation movements can be edited and filtered after the character gets animated. The FCurve windows can be edited and modified using FCurve windows. You can manipulate the entire animation by adding some of the specific curves, like TimeWarp curves. Moreover, there are several other filtering options available that can be used to filter the animations.

You can select a character from the drop-down list and load the character, but in case the character has to be modified, then by choosing the appropriate option, you can do that as well.
