

6) Timing and balancing of the character movement

Timing is an imperative aspect while defining the motion of the characters. The joyful and happier movements are usually sharp and quick, and in cartoons, it is important to define them properly. However, the sad moments should have slower movements so that the character appears as feeling down or upset.

Balancing is the first step in the life of every human being. With each step, we have to change our center of gravity to ensure that we do not fall on the ground. There are certain small changes in the movements, such as if you are standing, keeping your feet apart, and try to lift the right leg off the floor with a still waist, then it may be difficult to resist the weight on the left leg to avoid falling. There are some techniques developed by Disney for exaggerating animations at just the right moments for creating more impact, and these can be done by tweaking the MoCap data.

Here you may have to shift the center of gravity to balance. So, for defining your character, you must ensure that the character's movements are correct as well.

7) Do not form every letter for defining speech

When you animate the mouth or lips movement of the character, you need not include every character or word; this may give an erratic appearance to the character. In reality, the lips of the people do not form every letter physically. You can choose some of the key letters to define the lips moment and use them for the characters. **d**
